

INTERNSHIP REPORT
OF
GENERATIVE AI, LARGE LANGUAGE MODELS AND
AI VOICE ASSISTANT

Submitted To
School of Computer Science and Engineering
IILM University, Greater Noida, U.P.

In partial fulfilment of the requirement of degree of
B.Tech CSE

BY
ROLL NUMBER OF STUDENT: 2410031135

NAME OF STUDENT: Shabd Mishra

BATCH: B.TECH CSE

ACADEMIC SESSION: 2026-27

INTERNSHIP ORGANIZATION: GLOBUS INFOCOM LIMITED

INTERNSHIP PERIOD: 01 MAY 2026 – 15 JUNE 2026

INDEX

1. CANDIDATE’S DECLARATION

I, Girdhar Pathak, do hereby declare that the internship report titled “Generative AI, Large Language Models and AI Voice Assistant” has been completed by me to fulfil the requirement for the award of the degree of Bachelor of Technology in CSE. The report presents my learning, assigned responsibilities, technical understanding and internship experience at Globus Infocom Limited. Wherever information from external sources has been used, the relevant source has been acknowledged. I further declare that this report has not been submitted to any other institute for any degree or diploma requirement.

2. ACKNOWLEDGEMENT

I sincerely express my gratitude to Globus Infocom Limited for providing me the opportunity to undertake my internship in the Software Development Department at its Corporate Office, Noida. The internship gave me practical exposure to emerging areas of Generative AI, Large Language Models and AI-based voice interaction.

I am thankful to the mentors, team members and the People & Culture team for their guidance, constructive feedback and support throughout the internship period. Their professional environment helped me understand how AI concepts are explored, tested and converted into useful software-oriented solutions.

I am also grateful to my faculty members at the School of Computer Science and Engineering, IILM University, Greater Noida, for encouraging practical learning and industry exposure. Finally, I express my gratitude to my parents for their constant support and blessings.

3. INTERNSHIP COMPLETION CERTIFICATE

A copy of the internship completion certificate issued by Globus Infocom Limited is attached on the following page. The certificate confirms that Shabd Mishra successfully completed the internship in the Software Development Department at the Corporate Office, Noida, from 01 May 2026 to 15 June 2026, with involvement in Generative AI / Large Language Model initiatives, including an AI chatbot using LLMs and a voice assistant.

4. PROJECT DESCRIPTION

4.1 Introduction

The internship at Globus Infocom Limited focused on practical exposure to Generative Artificial Intelligence, Large Language Models (LLMs) and AI Voice Assistant concepts. The work was carried out in the Software Development Department. The internship completion certificate records involvement in an AI chatbot using LLMs and a Voice Assistant, along with effective contribution to assigned tasks.

My role was primarily a technical support and learning-oriented role within the larger internship activities. Although the assigned tasks were limited in scope, they were important for understanding the workflow of an AI application—from defining a user requirement and preparing inputs to interacting with a language model, evaluating responses and considering voice-based interaction. This report therefore describes my contribution as an important supporting role rather than claiming ownership of an entire production system.

4.2 Organization Profile

Globus Infocom Limited is a technology company based in Noida, Uttar Pradesh. Its official website describes the organization as a Make-in-India EdTech brand working on technology ecosystems for education and organizations. Its offerings include interactive displays, conferencing cameras, smart classroom solutions and software and solutions. The company also describes work across collaborative conferencing and professional displays, security and surveillance, institutional furniture and related technology solutions.

The company was established in 2001 and has developed education technology solutions along with broader technology products and services. Its registered/corporate address shown on its official website is A-66, Sector-4, Noida, District Gautam Buddha Nagar, Uttar Pradesh, India – 201301. The Corporate Identification Number is U72100UP2001PLC126647.

During my internship, I was associated with the Software Development Department at the Corporate Office in Noida. The internship certificate specifically identifies Generative AI / LLM initiatives, an AI chatbot using LLMs and a Voice Assistant as areas of involvement.

4.3 Problem Statement

Modern users increasingly expect software systems to understand natural language and respond quickly in a conversational manner. Traditional rule-based interfaces can become difficult to maintain when the number of possible user questions increases. A practical challenge is therefore to explore how Generative AI and LLM-based systems can support conversational interaction, while also making the interaction accessible through voice.

The internship problem was approached at an exploratory and prototype-support level: understand the basic working of an LLM-powered chatbot, examine suitable inputs and outputs, support testing of conversational responses, and understand how speech input and generated responses can form part of an AI Voice Assistant.

4.4 Project Objectives

- Understand the fundamentals and practical use of Generative AI and Large Language Models.
- Study the basic architecture of an LLM-based conversational chatbot.
- Understand prompt-based interaction and the importance of clear user inputs.
- Assist in testing and evaluating chatbot responses for relevance and usefulness.
- Understand the basic workflow of an AI Voice Assistant from speech input to response generation.
- Develop practical familiarity with AI application development and software-development practices.
- Document technical observations, challenges and learning outcomes from the assigned activities.

4.5 Scope of the Project

The scope of the internship project was limited to learning, experimentation, assigned implementation/support activities and evaluation related to Generative AI, LLM-based chatbot interaction and AI voice assistance. The work did not represent independent ownership of a complete enterprise-grade product. Instead, my contribution supported selected parts of the overall workflow, allowing me to understand the technology and contribute effectively within the responsibilities assigned during the internship.

The project scope covered conversational AI concepts, prompt formulation, response evaluation, basic voice interaction concepts, integration flow, testing and

documentation. Security, large-scale deployment, production monitoring, model training from scratch and enterprise-level infrastructure were outside the confirmed scope of my individual internship tasks.

4.6 Technologies and Tools Used

Technology / Tool	Purpose	Learning / Use
Generative AI	Content and response generation	Understanding AI-generated responses and use cases
Large Language Models	Natural-language understanding and generation	Conversational interaction and prompt-based experimentation
Prompt Engineering	Designing effective instructions	Improving clarity and relevance of model responses
AI Chatbot	Conversational interface	Understanding LLM-powered question-answer interaction
Speech Recognition	Converting voice input to text	Understanding the input stage of voice assistants
Text-to-Speech	Converting generated text to audio	Understanding the response stage of voice assistants
Python / scripting concepts	Supporting experimentation and automation	Basic programming-oriented AI workflow understanding
Testing & documentation	Evaluation of outputs and recording observations	Improving reliability and communicating results

4.7 System Architecture

The following architecture represents the conceptual workflow studied during the internship. It is an illustrative representation of the AI chatbot and voice-assistant flow and should not be interpreted as a confidential production architecture of Globus Infocom Limited.

User Input: Text question or spoken request
Input Processing: Text cleaning / speech-to-text conversion
LLM Layer: Prompt + context → Large Language Model
Response Processing: Generated answer / text-to-speech conversion
User Output: Chat response or spoken response

For a text chatbot, the speech stages are skipped and the text request is passed to the conversational model. For a voice assistant, spoken input is first converted into text, the text is processed by the conversational AI layer, and the generated response can then be converted back into speech.

4.8 Methodology

1. Requirement Understanding: First, the assigned activity was understood in terms of the expected user interaction and the role of AI in the solution.

2. Technology Study: The basic concepts of Generative AI, LLMs, prompting, conversational context and voice-assistant components were studied.

3. Prompt and Input Preparation: Clear and structured prompts or sample user questions were considered to observe how different inputs affect generated responses.

4. Prototype / Task Support: Within the assigned scope, I supported small technical activities related to chatbot and voice-assistant exploration, testing and refinement.

5. Response Evaluation: Generated responses were reviewed for relevance, clarity, consistency and suitability to the intended user query.

6. Iteration: Based on observations, inputs and prompts were refined where required and the behaviour was reviewed again.

7. Documentation: Important observations, concepts, workflow and learning outcomes were organized for reporting and future reference.

4.9 Expected Outcomes

- Improved understanding of Generative AI and LLM-based applications.
- Practical knowledge of how conversational AI systems process user queries and generate responses.
- Basic understanding of prompt engineering and response evaluation.
- Understanding of the major components involved in an AI Voice Assistant.
- Experience of working within a software-development environment and following assigned tasks.
- Improved analytical thinking, technical communication, testing and documentation skills.
- Awareness of practical limitations such as inaccurate responses, ambiguous prompts, context handling and the need for evaluation.

4.10 Internship Completion Certificate and Other Proof

The internship completion certificate issued by Globus Infocom Limited is attached in Chapter 3. The certificate confirms the internship period, department and the areas of involvement. Any additional internship communication mails, task sheets, screenshots or internal evidence should be attached by the student if available and permitted for academic submission. No confidential company material has been reproduced in this report.

5. KEY CONTRIBUTIONS AND LEARNING OUTCOMES

During the internship, I contributed within the scope of the tasks assigned to me. My contribution was not based on developing the entire AI system independently; rather, I played an important supporting role in understanding, testing and documenting selected activities connected with the chatbot and voice-assistant initiatives. This approach helped me connect academic concepts with a real software-development environment.

- Supported exploration of LLM-based conversational interaction and AI chatbot behaviour.
- Participated in evaluating sample prompts and generated responses.
- Helped understand how conversational context influences the quality of an AI response.
- Studied the end-to-end concept of an AI Voice Assistant, including speech input, language processing and spoken output.
- Observed the importance of testing, iteration and clear documentation in AI application development.
- Improved understanding of responsible AI considerations such as accuracy, user intent, privacy and response reliability.

5.1 Challenges Observed

- LLM responses can vary with small changes in prompts, so consistent prompt design is important.
- Generated responses must be reviewed because fluent language does not always guarantee factual correctness.
- Voice-based systems introduce additional challenges such as speech recognition errors, accents, background noise and response latency.
- Maintaining conversational context requires careful handling of previous user interactions.
- AI systems need suitable testing and human evaluation before being relied upon in important use cases.

5.2 Conclusion

The internship at Globus Infocom Limited provided valuable practical exposure to Generative AI, Large Language Models and AI Voice Assistant concepts. The experience helped me understand how an AI-based conversational solution can be

structured and evaluated in a software-development environment. Although my individual assigned tasks were limited in size, they contributed to my understanding of the broader initiative and allowed me to participate meaningfully in technical exploration, testing and documentation.

The internship strengthened my interest in Artificial Intelligence and gave me a clearer understanding of the difference between learning an AI concept academically and applying it in a practical software environment. The experience will be useful for future academic projects and more advanced work in AI/ML.
